The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 10% identity with sequences: KAEYKNKHRH (1) or TRLIMKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (1) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring, receptor-competent LDL particles do not require the complete apo B sequence, which is large and tends to aggregate, to provide binding affinity to an apo B protein receptor

This sequence is an example of the peptide of the invention. It has the formula (I), or their variants with one or more internal deletions, insertions or substitutions, while retaining anti-coagulant properties of apolipoprotein B-100 (apoB-100). Z1-KAQ-X1-KKNKHRHS-X2-T-Z2 (I) X1 = S or Y; X2 = T or I; Z1 = the N terminus of the peptide, or 1-47 amino acids (aa); Z2 = the C terminus of the peptide, a terminal amide group or 1-77 aa. Compositions containing the peptide are used for simultaneous, separate or sequential treatment of cancer, particularly to prevent
                                                                                                                                                                                                                                                                                                                    Peptide fragments of apo:lipo:protein B-100 with anticoagulant activity used for treating or preventing coagulation, inhibiting angiogenesis, cell differentiation and apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present low density lipoprotein (LDL) binding peptide can be used an absorbent to remove LDL from body fluids, or as a LDL binding reage the peptide can be prepared easily and at low cost, and has excellent stability and preservability. It specifically binds LDL, and does not cause bradykinin production, white blood cell activation or blood

                          AAW57208 standard; Peptide; 22 AA.
                                                                                                                             The invention relates to a novel ligand for binding a target biomolecule, which comprises a peptide having at least one sulphated or sulphonated charged amino acids. The movel ligands can be used for the treatment of invantion acids the movel ligands can be used for the treatment of invantion acide arthritis, diabetic retinopathy and hypoxia.
                                                                                                                                                                                                      Use of a ligand comprising of at least one sulfated or sulfonated amino retinopathy and hypoxia.
                                                                                                                                                                                                                                                                 WPI; 2003-300420/29.

                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a specifically claimed Apo B 100 binding site peptide analogue which can be used as a component of a nonnaturally occurring, receptor-competent low density lipoprotein (LDL) particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lipophilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KARYKUNKIRH (1) or TRALTRKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (1) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives for cell culture media especially as growth supplements. Non-naturally occurring, receptor-competent LDL particles do not require the complete apo B sequence, which is large and tends to aggregate, to provide binding affinity from a non-particle sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Apo B;

29-AUG-2003

(first entry)

Human PDGFR-beta related navigation peptide

SEQ ID NO:25

PDGRR-beta; platelet derived growth factor receptor beta; nanoparticle; delivery; encapsulated molecule; cytostatic; antimicrobial; gene therap; sustained delivery; cell proliferation disorder; infectious disease; genetic defect; aberrant gene regulation.

therapy;

Homo sapiens

```
The present sequence represents a specifically claimed Apo B 100 binding site peptide analogue which can be used as a component of a non-comparation of the present invention. The LDL particle of the present invention. The LDL particle comprises at least 1 peptide component that has at least 1 binding site for an apo B protein receptor and at least 1 lippphilic substituent. Also described in the invention are peptides containing an apo B binding sequence with at least 70% identity with sequences: KAEYKNNEHR (1) or TRLTRKRGLK (2), or their dimers. Non-naturally occurring, receptor-competent LDL particles are useful as: (i) drug-targeting vectors for delivering anticancer drugs to cancer cells that express an apo B protein receptor, and (ii) additives occurring, receptor-competent LDL particles do not require the complete occurring, receptor-competent LDL particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not require the complete affinity for an apo B protein particles do not provide binding

The present invention describes nanoparticles (I) capable of delivery of CC an encapsulated molecule into a living cell, comprising an encapsulation CC acid homologue sequence (II) encapsulated with EM, where the CC time. (I) have cytostatic and antimicrobial activities, and can be used completed extended period of in gene therapy. (I) can be used for sustained delivery and release of a CC homology within (I), and introducing (II) into the subject. (I) can also be used for treating a medical condition of a subject by sustained delivery homologue sequence designed to alleviate symptoms of the medical condition within EM, so that nanoparticles are formed, and delivering the sequence is released over an extended period of time. A pharmaceutical composition comprising (I) can be used for treating a medical over the isolated nucleic acid homologue sequence designed to alleviate symptoms of the medical condition within EM, so that nanoparticles are formed, and delivering the sequence is released over an extended period of time. A pharmaceutical composition comprising (I) can be used for treating a medical condition defect and abservant gene regulation. The nanoparticles are capable of introducing the nucleic acid into the cell very efficiently. The present contains a platelet derived growth factor receptor beta (PDGFR present invention)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         US-09-265-222-20
Sequence 2, Application US/09269533A
Patent No. 6670452
GENERAL INFORMATION:
APPLICANT: University of Strathclyde
APPLICANT: Halbert, Gavin
APPLICANT: Wens, Moira
APPLICANT: Baillie, George
TITLE OF INVENTION: No. 6670452-Naturally Occurring Lipoprotein Particle
FILE REFERENCE: P07885US
CURRENT APPLICANTON NUMBER: US/09/269,533A
CURRENT FILING DATE: 1999-06-01
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GENERAL INFORMATION:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

hypocholesterolenia.";
-1- FUNCTION: Apolipoprotein B is a major protein constituent of chylomicrons (apo B-48), LDL (apo B-100) and VLDL (apo B-100). Apolipoprotein B-100 functions as a recognition signal for the cellular binding and internalization of LDL particles by the apoB/E receptor.
